Lab #6 Design Document

The approach I took to testing my linked structures was to implement add and remove functions in the main function. Additiionally I created a view list function that allowed me to see the elements in the function after numbers were added and removed. I have found that printing the output of what you expect the program to do is very useful in determining if that is indeed what the program is actually doing.

I think I get the jist of the lab and how linked structures actually work, and I'm excited to see how they can be effectively implemented in future projects.
